Epic 2 — Household Utility Consumption Tracking

1. Did your estimations reflect the actual effort?

Yes, the estimations reasonably reflected the actual effort required. The simpler stories were assigned lower story points, while stories involving calculations, tracking, or comparisons were given higher points. Since the stories were completed successfully during the simulated sprint, the estimates were generally appropriate.

2. Was your backlog well-prioritized?

Yes, the backlog was well-prioritized based on the importance of each requirement. High-priority requirements related to carbon calculation, utility logging, and reduction tracking were placed above the medium-priority historical comparison requirement. This helped ensure that the most important functionality was addressed first.

3. How did your simulated sprint align with your plan?

The simulated sprint generally aligned with the plan. The selected stories were added to Sprint 1, assigned story points, and moved through **To Do → In Progress → Done** as planned. The sprint successfully demonstrated the intended Agile workflow.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed how the remaining story points decreased as work was completed. It indicated that the team was able to complete the planned sprint work within the simulated sprint. It also showed that the team's capacity was sufficient for the amount of work selected for the sprint. The handout notes that the burndown chart can be used to identify whether a team is completing work as expected and to understand its capacity.
